Estimated Completion Date	Next Update Date

Revision Description

Reliability investigations are ongoing.

Closing the FTD due to operator interaction.

Description

The Component Reliability Collaboration (CRC) program was initiated in August 2008 to systematically develop root cause/ corrective action for components removed during Boeing production and within the first 12 months of service after airplane delivery. The goal of this program is to eliminate, where practical, all infant mortality type component removals which were due to quality issues or manufacturing defects. This investigative work is being done either by the Supplier and/or a joint Supplier/ Boeing working team. Issues to be assessed and investigated are determined by Boeing during regularly scheduled component selection meetings. For those items in work, progress is reviewed weekly on a rotational basis, with a CRC participating supplier, during Boeing's Component Review Board (CRB) meetings. These meetings are comprised of several Boeing organization stakeholders including (but not limited to) the Fleet Chief office, Program Engineering, Service Engineering, Supplier Management, and Supplier Quality. The CRB also reviews and concurs with working team schedules and action plans. During or after these investigations where information or actions would be beneficial for operator's consideration, Boeing will release a specific FTD article (or other form of communication) detailing the component's issue and investigation information. These CRC related component FTD's should have a "CRC" FTD category selected. The baseline criteria for creating a CRC FTD or other document is as follows:

1) When the Supplier/Boeing has a technical resolution where a Service Bulletin, Service Information Letter, or equivalent document is published.

2) When the removal reason/issue was resolved by creating/updating a technical manual like CMM, AMM, or FIM.

3) When there is a special situation where the issue has significant customer concern or impact.

Status

The attached (Illustration) contains a list of components that are currently being investigated (active) or that have been previously assessed and the activity is now completed (archive). Please note that the archived items are for historical reference only. Boeing anticipates that the file attachment and this article will be updated at least quarterly to convey changes to or completion of those components being investigated.

FLEET TEAM DIGEST

Interim Action

None.

Final Action

Boeing will continue to investigate the higher volume component removals that occur during airplane production and the first year of service and will work with suppliers to improve their pro-active detection and resolution of component quality issues. Our intention is to improve the overall quality output by Boeing and our supply base by instilling rigorous quality management practices within the production system. The expectation is for new airplane reliability (during 1st year of service) to exceed the fleet's average overall reliability. We expect this to be accomplished by minimizing, as much as practical, these type of infant mortality component removals/failures.

Operator Action

Part of Boeing's effort to identify early component failure trends is dependent on in-service component removal data from airlines. We encourage operators to provide this data via the In Service Data Program (ISDP) and through the 12 Month Airplane Quality Program (12MAQ) via their Boeing Field Service representatives. Should an operator desire an investigation status or additional details on any component listed in the attachment, an update can be provided by Service Engineering by submitting a BCS message under the appropriate airplane model and ATA for that component (making reference to this or other relevant FTD).

Supplier Information

CRC Participant Suppliers for the 737MAX:

BAE Systems

GE Aviation

Honeywell

Panasonic

Rockwell-Collins

UTAS (Hamilton Sundstrand)

Suppliers BE Aerospace, Parker, and Thales will begin participating in the CRC starting in 2017.
