Structures – General Data

1. General

The DHC-6 Twin Otter is an all metal and composite, high-wing monoplane, powered by two Pratt and Whitney PT6A–34 (Mod 6/2012) engines driving Hartzell fully-feathering, reversing and constant-speed propellers. The aircraft is designed for passenger or general cargo carrying, and is provided with a fixed tricycle landing gear having a steerable nose wheel. Provision has been made for floats and amphibious floats; however, these are only available via incorporation of Supplemental Type Certificate.

The wing group consists of the metal wings, wing struts, wing fences and nacelles.

The fuselage is aluminum alloy, semimonocoque construction consisting of longerons, longitudinal stringers, intercostals, frames and stressed skin panels.

The tail group consists of horizontal and vertical stabilizers, elevators and a rudder. The horizontal and vertical stabilizers are both secured by front and rear fittings to corresponding fittings in the rear fuselage structure.
