FUEL LINES - DESCRIPTION AND OPERATION

1. Description and Operation

The fuel supply to the engine is directed from the oil-to-fuel heater to the fuel pump, and from the fuel pump to the fuel control unit (FCU), through flexible hoses. Metered fuel from the FCU to the fuel manifold is through stainless steel line(s).

The fuel delivery hose assemblies each consist of a fluorocarbon plastic inner core with a stainless steel overbraiding and an asbestos and synthetic rubber outer covering. The outer covering acts as a fireshield. Stainless steel fittings are incorporated at each end of the assemblies.

The stainless steel delivery tube assemblies each consist of a preformed seamless tube with stainless steel end fittings.
