Auto Flight – General Data

1. General

The Automatic Flight Control System (AFCS) is the integration of Mod 6/2303 Flight Director (FD) and S.O.O. 6221 Autopilot Systems. The FD displays pitch and bank angles required for the aircraft to follow a selected path. The FD can be coupled with an optional three-axis Autopilot. When integrated the AFCS controls the aileron, elevator, and rudder servos to maintain the desired aircraft attitude. The optional Autopilot (S.O.O. 6221) includes a yaw damper and electric pitch trim servo system.
