Emergency Shutdown – General Data

1. General

As the oil system is an integral part of the engine, only the fuel system is provided with an emergency shut-off control. The fuel system emergency shut-off consists essentially of two emergency shut-off switches, one for each engine, mounted on the emergency panel and two firewall mounted shut-off valves (refer to 28-20-25, Emergency Shut-off Valve – Maintenance Practices). Each switch is labeled FUEL with marked OFF and NORMAL positions. The emergency shut-off circuits are protected by circuit breakers, mounted on the main circuit breaker panel, labeled FUEL SHUTOFF L and FUEL SHUTOFF R.
