Auxiliary System – General Data

1. General

The auxiliary system consists of a hydraulic handpump with a suction line from the reservoir and a pressure line connected into the power system on the hydraulic power package.

A. Hydraulic Handpump (Mod 6/2093)

The hydraulic handpump is of the double acting type, displacing an equal amount of fluid on each stroke. The handpump is installed beneath the flight compartment floor immediately to the left of the control column base. A hinged door provides access to the handpump and the handle is stowed on the sub-floor, right-hand side.
